Team 7 - Meeting Minutes

Project: Web-Based Language Scavenger Hunt Game (Lost In Translation!)
Meeting Date: Tuesday, October 27
Next Meeting: Thursday, October 29 (in class, demo and review with TA)
Attendees: Gamuchirai Mhere, Madiba Burks Magara, Ashish Nayak, Dan Rukundo

Agenda

Plan this week's work on points and levels, decide on game rules (attempts and timer), split up dashboard and backend tasks, and prepare for Thursday's demo.

Discussion

- **Weekly goal:** Extend the demo and the game to include points and levels. Work backwards from the client demo: create an account, sign in as a student, and sign in as a teacher (with the teacher dashboard).
- **Photo and audio limits:** Photos aren't stored in the database, so extra uploads don't break anything. Ideas included capping uploads per level (zero points if maxed out) or limiting audio listens by difficulty, but expert levels have a lot of text, so 3 listens may not be enough. Decision: unlimited photo uploads and audio listens for now, and ask the client first. Unlimited makes less sense for a game but more sense for class-assigned tasks.
- **Points and timer:** Points will be based on attempts, not time (e.g. 50 points for getting it right on the first try), because pause/resume would make time-based scoring easy to cheat. Time is still tracked like a stopwatch (like Canvas quizzes): it starts when the hunt begins and stops when it ends, even if the student leaves. The end screen can show something like "you finished in 20 minutes", and time can be added to dashboards later.
- **Levels and languages:** Game flow: start game, pick a language, then pick a difficulty. Stick to French for now. Levels need audio for each difficulty and language, plus frontend screens to choose them. Hints are connected to levels. Several board tasks are really all the same level work and could be done in one week.
- **Missing endpoints:** Building the frontend showed the backend is missing many endpoints. New idea not in the requirements: teachers should be able to assign hunts to a class (choosing language, number of levels and difficulty), and students would see hunts inside their classes. This will probably need several endpoints.
- **Dashboards:** Teacher and admin dashboards will be one shared page that shows different controls depending on the user's role (e.g. only admins can delete a teacher). The class roster backend (add/remove students) already exists, so only the frontend page is needed. For the demo, pages just need to work, using the same simple style.
- **Badges and prizes:** Badges and redeeming points depend on how points are calculated, so Gamu needs to coordinate with Dan on the points system first.
- **Docker volume:** PaddleOCR currently downloads the whole model on the first photo, which is slow. Moving it to a Docker volume keeps it between resets. Audio may move to a Docker volume too.

- **GPS elevation:** Dan had elevation working, but it isn't accurate. Being off by a metre or two could put a student on the wrong floor. This is already in the logs and will be raised with the TA.
- **Dan's workload:** Dan has a lot assigned and couldn't be reached during the meeting. Points is the top priority since badges and redeeming depend on it. Other options for him: GPS demo hookup, hints, levels and the language picker.

Action Items — Due Saturday, October 31

#	Task	Details	Assignee
1	**Pause/resume session (#150)**	Let students pause a hunt and resume it later.	Ashish
2	**Stopwatch time tracking**	Store each hunt's start and end time and calculate the time taken. Time is shown, not used for points.	Ashish
3	**Move audio to Docker volume**	Look into storing the audio files in a Docker volume.	Ashish
4	**Persist PaddleOCR model in Docker volume (#148)**	Keep the OCR model in a Docker volume so it doesn't download again on the first photo after every reset.	Madiba
5	**Points system**	Top priority: attempts-based points (more points for fewer tries). Badges and redeeming depend on it. Other options: hints, levels, language picker.	Dan
6	**GPS location with photos (#151, #152, #153)**	Connect the GPS check to the demo: send the student's location with game photos and check it when they submit an answer.	Dan
7	**Badges and redeeming points**	Badges and a way to spend points on	Gamu

		prizes, shown on the dashboard. Check with Dan on how points work first.	
8	**Admin/teacher dashboard**	One shared dashboard page that shows admin-only controls based on role. A basic version for the demo first.	Gamu
9	**Teacher assigns hunts**	Endpoint(s) so teachers can assign hunts to a class, choosing language, number of levels and difficulty.	Gamu
10	**Leaderboard**	Leaderboard, including a class leaderboard.	Madiba
11	**Class roster page**	Basic frontend page to add and remove students from a class, using the existing backend endpoint.	Madiba
12	**Check in with Dan**	Let Dan know his options this week, with points as the top priority.	Madiba

Notes

- Questions for the client: should photo uploads and audio listens be limited?
- Question for the TA: GPS elevation isn't accurate enough to tell floors apart. How should we handle it?
- For the demo, Ashish will save the current working commit hash and revert to it if later changes break something. Have backup videos ready in case the live demo fails.
- Expect more feedback and changes after Thursday's review.
- Ashish will add possible future endpoints to the Kanban To Do column to make weekly planning easier.
- Everyone will post their weekly task list in Discord and add their tasks to the Kanban.
