Team 7 - Meeting Minutes

Project: Web-Based Language Scavenger Hunt Game (Lost In Translation!)
Meeting Date: Tuesday, October 20
Next Meeting: Thursday, October 22 (weekly check-in with TA and prof)
Attendees: Gamuchirai Mhere, Madiba Burks Magara, Ashish Nayak, Dan Rukundo

Agenda

Plan the GPS and OCR work, decide when to start the frontend, and split up the next backend tasks.

Discussion

- **GPS location check:** GPS isn't fully finished yet. The plan: the frontend gets the student's GPS location, sends it to the backend, and the backend checks if it's close enough to the latitude/longitude the teacher set (for example, within 50 metres). Keep it simple for now.
- **GPS details:** No Google Maps API is needed, since browsers already give GPS access. Floor/elevation problems can wait and may be solved by image recognition instead. A map screen during the game probably isn't needed, because GPS is only captured when the student takes a photo. For testing, right-click a spot in Google Maps to get its latitude and longitude.
- **OCR vs image recognition:** OCR is already under image recognition in Milestone 1. OCR is cheaper, but image recognition is better at stopping cheating because it compares the actual sign (look, angle, lighting), not just the numbers. It could also solve the wrong-floor problem. It may not be as high-maintenance as first thought for a small game.
- **Starting the frontend:** The team agreed to start frontend work now, because photo submission and GPS collection depend on it. This includes the camera photo upload interface from the milestone requirements.
- **Pages to build:** Create account, login, dashboard/main page, and the main game screen ("Lost in Translation" play flow). Pages will be linked together gradually.
- **Design:** Make a wireframe/prototype first (Figma and its AI features were suggested). Style should be bright, playful and a bit cartoony so it feels like a game, not a school assignment. Colours and design choices go in the MD file. The design/template should be finalized before pages are split across PRs, since frontend code can make very large commits.
- **Device testing:** Test on iPhone and Android. Chrome DevTools can emulate phones (e.g. Pixel 9 Pro). Check during development that layouts don't break on different screen sizes.

Action Items — Due Saturday, October 24

#	Task	Details	Assignee

1	**Generate 5 random locations (#100)**	When a hunt starts, the system picks exactly 5 random locations from the pool, with no repeats.	Ashish
2	**Camera/photo upload interface (#101)**	Frontend screen where students take or upload a photo of the room/office number. Submit stays disabled until a photo is attached.	Gamu
3	**Limit image recognition attempts (#102)**	Cap image recognition attempts per location (max 3). After that, log the failed attempt and block more tries until reset/shuffle.	Madiba
4	**OCR/Image recognition (#103)**	Check the student's photo against the answer. Correct: success screen and points. Wrong: tell the student, no points.	Madiba
5	**Teacher's enrolled students endpoint (#104)**	API endpoint returning a teacher's students with their points and levels played. Students calling it get "unauthorized".	Ashish
6	**Student's own account details endpoint (#105)**	API endpoint returning a student's username, classes, languages and profile icon. Asking for another student's data gets "unauthorized".	Dan
7	**GPS location detection (#106)**	Check whether the student is within the location's GPS radius when they upload a photo during a hunt.	Dan

8	**Frontend: login/signup form (#107)**	Login/signup form for students and teachers. A good signup creates the account; an email already in use shows an inline error.	Gamu

Notes

- The GPS work may be big enough to cover 3 PRs.
- Currently taken: OCR and the 5-location selection task.
- Later backend work: class roster API (GET all students in a teacher's class) and student details API (GET profile data like classes and profile picture).
- Madiba will message the group with the list of what's being worked on, including the frontend pages.
